

ABSTRACT OF THE DISCLOSURE

A flower ornamental assembly for accommodating a flowerpot including a support post having the lower part buried in the ground and erected upward from the ground level, a flower ornament pot having a through-hole for penetrating the support post, and a filler filling up the surrounding of the support post inserted into the flower ornament pot. A flowerpot is accommodated in an opening at the upper end of the flower ornament pot. The flower ornament pot is erected and supported by the support post and the filler, so that it can be prevented from sway or tilt. Since the entire structure of the flower ornament pot is exposed above the ground, the appearance of the flower ornamental assembly is enhanced.
